

OCCASIONAL PRESSRELEASE - Option launches a new Energy Management Systems (EMS) division

Leuven, Belgium – 13 February 2026 – 7:30 AM CET, Option NV, Geldenaaksebaan 329, 3001 Heverlee
(Euronext Brussels: OPTI)

Option NV announces that it is establishing an EMS division in which its advanced IoT technology (Cloudgate gateways & sensors) will be used to measure, control, and optimally manage all energy-related assets in industrial and public buildings and sites.

By digitally connecting energy assets (production & consumption), monitoring them in real time and controlling them intelligently, Option offers scalable solutions allowing recurring savings and attractive returns on investment.

Option is about to sign several contracts in Belgium and France that could generate a significant increase in revenue this year.

Option will call on partners such as IQ Solar and Maro Technics to carry out the physical installation of solar panels, among other things.

Option will use its own expertise for the unlocking and implementation of data-related activities (as well as ensuring the security of the data).

Option is still investigating various possibilities for integrating the individual sites within an overarching software platform.

Option plans to roll out this solution internationally as well.
