About CO2 Capsol

Carbon capture, utilization, and storage (CCUS) is crucial to achieving net zero emissions of greenhouse gases by 2050. CO2 Capsol's carbon capture technology is an essential part in a successful clean energy transition. Carbon capture contributes both to directly reducing emissions in critical economic sectors and to remove CO₂ from facilities such as Waste-to-Energy (WtE) and biomass power plants - so-called negative CO₂ emissions. Negative CO₂ emissions will be essential in compensating for hard to abate emission sources. CO2 Capsol is proud to be part of the solution for a sustainable future.

CO2 Capsol has a very competitive technology protected by IP rights. The base case revenue model is to license out patents. We negotiate directly with project owners or participate by collaboration with industrial players.

CO2 Capsol is listed on Euronext Growth Oslo, Norway (ticker: CAPSL).
